No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                           Score

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CC human plasminogen activator inhibitor (PAI) mature protein (see Luman plasminogen activator inhibitor (PAI) mature protein (see CC also AAW31587). It has an Ala for Val substitution at amino acid cresidue 343, i.e. in the reactive centre loop of the protein of the mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAW379703) and expression in a host cell. Claimed PAI-1 mutants (see AAW379703) and expression in a host cell. Claimed PAI-1 mutants (see AAW379703) and expression in a host cell. Claimed PAI-1 mutants (see AAW379703) and expression in a host cell. Claimed PAI-1 mutants (comparison per pair of His-150, Thr-154, Leu-319 and Ide-314, and one or more of Axg-333, Axg-335, Cly-331, Ile-372 and Leu-91. The mutants are characterised by being resistant to inactivation by elastase, and by having a high affinity comparison one and and a stronger activator, plasmin, cathepsin G, chymase, gelatinases A and B, strongelysin and collagenase, and by having a high affinity cathepsin G, chymase, gelatinases A and B, strongelysin and collagenase, and by having a high affinity cathepsis (all transportation (Vn) and are used, in vivo or in vitro, to inhibit cather and the comparison of protein and collagenase, and by having a high affinity cathepsis at cather and collagenase, arthiftis and HI infection). They also inhibit Vn-stimulated cell attachment, migration and/or chapsis of the lump, wound cather and solve trauma, vascular graft restenosis, fibrosis (associated with cather and collagenase) and fibrosis grantina formation and or healtion involving and fibrosis grantination of primary condition involving apathological angiogenesis (all claimed). Since the mutants are resistant to claevage by the proteases to which they are more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1) condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

CC human plasminogen activator inhibitor (PAI-1) mature protein (see also AAMA31587). It has an Asp for Val substitution at amino acid calso AAMA31587). It has an Asp for Val substitution at amino acid comparative and the protein activator in the reactive centre loop of the protein. The commutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAM797303) and expression in a host cell. Claimed PAI-1 mutants (see AAM26710-25) have at least one amino acid substitution at amino acid substitution at composition 343-350, especially at position 343 and/or 346, and may be expression in a host cell. Claimed PAI-1 mutants (see AAM26710-25) have at least one amino acid substitution at position of His-150, Thr-154, Leu-319 and Ide-354, and one or more of four of His-150, Thr-154, Leu-319 and Ide-354, and one or more of Arg-333, Arg-335, Gly-331, Ide-372 and Leu-91. The mutants are characterised by being resistant to inactivation by elastase, plasminogen activator, plasmin, cathepsin (s. chymase, gelatinases A composition of plasminogen activation (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation, congenital alpha 1-antitypsin deficiency, cystic fibrosis, atopic dermatitis, capanteratitis, periodontal disease, arthritis and HIV infection).

CC post-angioplasty restencesis, neointima formation after vascular migration induced proliferation (specifically in atherosclerosis, cost-fically in 
                                                                                                 promote uptake and clearance of elastase (or its complex with PAI-1) by receptors.

(NB. the amino acid sequence of the mutant protein was obtained by:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Plasminogen activator-inhibitor type I mutant inhibits elastase has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.

inclair Cain be obtained by streetching the contract call. Claimed pAt-1 mutants it (see AAW26710-25) and expression in a host cell. Claimed pAt-1 mutants it position 343-350, especially at position acid substitution at position 343-350, especially at position acid substitution at position 343-350, especially at position 343-360/07-346, and may it position 343-350, especially at position 343-360/07-346, and may it is comprising between one and it is comparable to the comparable of the comparab
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This polypeptide comprises a preferred mutant, P4Gly (V343G), of human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has a Gly for Val substitution at amino acid residue 343, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAM37303) and expression in a host cell. Claimed PAI-1 mutants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Plasminogen activator inhibitor type 1; PAI-1; human; elastase; inhibitor; vitronectin; cell attachment; cell migration; cell proliferation; emphysema; adult respiratory distress syndrome; acute lung inflammation; alpha 1-antitrypsin deficiency; cystic fibrosis; atopic dermatitis; pancreatitis; periodontal disease; arthritis; HTV; atherosclerosis; restenosis; neolntima; fibrosis; wound healing; tumour; metastasis; psoriasis;

```
This polypeptide comprises a preferred mutant, P4Leu (V343L), of human plasminogen activator inhibitor (PAI-1) mature protein (see also AAW31587). It has a Leu for Val substitution at amino acid cresidue 343, i.e. in the reactive centre loop of the protein. The mutant can be obtained by site-directed mutagenesis of PAI-1 DNA (see AAW36710-25) have at least one amino acid substitution at position 343-350, especially at position 343 and/or 346, and may have additional stabilising mutations comprising between one and cour of His-150, Thr-154, Leu-319 and Leu-91. The mutants are characterised by being resistant to inactivation by elastase, plasminogen activator, plasmin, cathepsin G, chymase, gelatinases A and B, stromelysin and collagenase, and by having a high affinity pathological elastase activity (specifically in emphysema, adult respiratory distress syndrome, acute lung inflammation, congenital
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              alpha 1-antitrypsin deficiency, cystic fibrosis, atopic dermatitis, pariodontal disease, arthritis and HIV infection). They also inhibit Vn-stimulated cell attachment, migration and/or They also inhibit Vn-stimulated cell attachment, migration and/or constraint of the cell of trauma, vascular yraft restenosis, nebintima formation after vascular trauma, vascular graft restenosis, fibrosis (associated with chronic inflammation or chemotherapy, or of the lung), wound healing with scarring and fibrosis, growth/invasion of primary tumours or metastases, psoriasis, deep vein thrombosis and any condition involving pathological angiogenesis (all claimed). Since the mutants are resistant to cleavage by the proteases to which they bind, they are more effective therapeutic agents. They also promote uptake and clearance of elastase (or its complex with PAI-1)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The sequence represents human plasminogen activator inhibitor-1, corrections of the invention of the enzyme in a biological sample and measuring the binding of the enzyme inhibitor to the active form of the enzyme by a detectable of label, where the enzyme inhibitor specifically forms a covalent bond or binds with a dissociation constant of 1 x 10-9M or less with the active of the detection of a functionally active form of an enzyme in a biological of the detection of a functionally active form of an enzyme in a biological consumple. Human pAI-1 can be used to detect a number of enzymes including tissue plasminogen activator, urokinase, thrombin, plasmin, neutrophil cellastase, pancreatic elastase, trypsin, chymotrypsin, cathepsin G and prostate specific antigen and as such can be used in methods to diagnose of issasses such as cystic fibrosis, acute respiratory distress syndrome (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and benign prostatic hypertrophy.

CC wote: The present sequence is not shown in the specification but is considered from the mature PAI-1 sequence shown in the specification but is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The sequence represents human plasminogen activator inhibitor-1, (CC PAI-1, mutant P4Asp (V343D). PAI-1 is a serine proteinase inhibitor CC or serpin. The protein is used to demonstrate the method of the invention which comprises detecting a functionally active form of an enzyme in a CC biological sample by contacting an enzyme inhibitor immobilised on a CC solid substrate with the biological sample and measuring the binding of CC the enzyme inhibitor to the biological sample and recovalent bond or label, where the enzyme inhibitor specifically forms a covalent bond or CC binds with a dissociation constant of 1 x 10-9M or less with the active form of the enzyme. The present invention provides a sensitive method for CC the detection of a functionally active form of an enzyme in a biological cc sample. Human PAI-1 can be used to detect a number of enzymes including tissue plasminogen activator, urokinase, thrombin, plasmin, neutrophil cc lastase, pancreatic elastase, trypsin, cathepsin G and CC prostate specific antigen and as such can be used in methods to diagnose cdiseases such as cystic fibrosis, courte respiratory distress syndrome CC (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and benign prostatic hypertrophy.

CC derived from the mature PAI-1 sequence shown in the specification but is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence represents human plasminogen activator inhibitor-1, parish, mutant p401y (V3430). PAI-1 is a serine proteinase inhibitor or serpin. The protein is used to demonstrate the method of the invention which comprises detecting a functionally active form of an enzyme in a biological sample by contacting an enzyme inhibitor immobilised on a contact of the enzyme inhibitor to the active form of the enzyme the binding of the enzyme inhibitor to the active form of the enzyme by a detectable label, where the enzyme inhibitor specifically forms a covalent bond or binds, with a dissociation constant of 1 x 10-9M or less with the active form of the enzyme. The present invention provides a sensitive method for the detection of a functionally active form of an enzyme in a biological sample. Human PAI-1 can be used to detect a number of enzymes including tissue plasminogen activator, urckinase, thrombin, plasmin, neutrophil celastase, pancreatic elastase, trypsin, chymotrypsin, cathepsin, G and prostate specific antigen and as such can be used in methods to diagnose diseases such as cystic fibrosis, acute respiratory distress syndrome (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and benign prostatic hypertroph—mediated inflammation, prostate cancer and derived from the mature PAI-1 sequence shown in the specification but is
                                                                                                                                                                                                                                                                                                                                              Matches

The sequence represents human plasminogen activator inhibitor-1, corrections of the invention of the invention of reprintant P4Leu (Y343L). PAI-1 is a serine proteinase inhibitor or serpin. The protein is used to demonstrate the method of the invention which comprises detecting a functionally active form of an enzyme in a considerable by contacting an enzyme inhibitor immobilised on a considerable by contacting an enzyme inhibitor immobilised on a considerable of the enzyme inhibitor to the active form of the enzyme by a detectable the enzyme inhibitor to the active form of the enzyme in the binding of the enzyme inhibitor specifically forms a covalent bond or binds with a dissociation constant of 1 x 10-9m or less with the active form of the enzyme. The present invention provides a sensitive method for the detection of a functionally active form of an enzyme in a biological sample. Human pAI-1 can be used to detect a number of enzymes including tissue plasminogen activator, urokinase, thrombin, plasmin, neutrophil constate specific antigen and as such can be used in methods to diagnose (ARDS), HIV infection, TNF-mediated inflammation, prostate cancer and consign prostatic hypertrophy.

Note: The present sequence is not shown in the specification but is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The N-terminal sequence of this protein can be deleted to leave SIVH or VH. The Val residue of mature PAI-1 corresponds to residue 24 of the preprotein. It may alternatively begin MVH. The protein is used in tests to identify inhibitors of its binding to tissue plasminogen activator. It is also used therapeutically to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New recombinant functional human plasminogen activator inhibitor - and plasmid expression vectors for its prodn. in E. coli, used for assays of T-PA PAI-1 inhibitors and treatment of excessive fibrinolysis

The protein inhibits both t-pA and u-pA and is immunologically different from protease nexin and placental PAI. It can also be used in a solid phase assay for detection of endothelial PAI, and as an immunogen to raise antibodic for use as receptor molecules in other assay systems. See also AAP80252-54.
                                                                                                                                                                                                                                                                                                                                      Sequence of human endothelial encoded by PAI2350 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Diagnostic assays for tissue - and urokinase-type plasminogen inhibitor - and pure, recombinant human endothelial plasminogen activator inhibitor.

A human umbilical cord endothelial cell cDNA library was screened with 4 oligonucleotide probes based on the Known PAI-1 sequence. A 2.1kb insert was identified in the most strongly positive clones. It was inserted into pTZ19R to give pECB3-1 and the sequence given here. To produce mature protein, the leader sequence was removed by partial digestion with ApaLI and NS1I of HaeIII-methylase treated pECB3-1 DNA. The resulting 1800bp fragment was attached to an adaptor (to restore the first 2, Met-Val, amino acids), digested with Ncol and inserted onto Ncol-PStI cleaved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Colonies of human endothelial cDNA were screened using the probe (AANRI522) and a heterologous antiserum to detect the presence of human endothelial PAI like polypeptides. Novel recombinant DNA molecule for use in cloning and/or expressing DNA sequence in host cells which contains, in addition to a vector protein, a DNA sequence coding for human PAI is

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  pKK233-2 to give plasmid ptAC-PAI. This expresses mature PAI-1 with the N-terminus Val-His-His which is useful in tests to identify inhibitors of its binding to tisse plasminogen activator. The protein is also used therapeutically to treat excessive or inappropriate fibrinolysis, e.g. during liver transplant surgery. See also AAQ06590-Q06593.
                                                                                                                                                                                                                                                                                                                                                    /note-

                                                                                                                                                                 This polypeptide sequence comprises wild-type human plasminogen activator inhibitor type (PAI-1). Novel mutants (see AM26710-25) c the PAI-1 mature protein are claimed that inhibit elastase or other elastase-like proteases, or are inhibitors of vitronectin-dependent cell migration. The mutants are obtained by site-directed mutagenesis of the PAI-1 DNA sequence (see AAT97303) and expression in host cells, and have a range of therapeutic uses. Preferred mutants have amino acid substitutions in the reactive centre loop region (especially at position 343 and/or 346 of the mature protein), and may have additional stabilising amino acid substitutions at 1-4 of residues 130, 154, 319 and 354, and 1-5 of residues 333, 335, 331, 372 and 91.
                                                                                                                                                                                                                                                                                                                                                                        Claim 3; Fig 4A; 144pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                    Plasminogen activator-inhibitor type I mutant inhibits elastase has high affinity for vitronectin, for therapeutic inhibition of elastase or vitronectin-mediated cell attachment, migration etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           11-APR-1997;

A; Residues: 370-375 <STO>
C; Comment: This inhibitor acts as "bait" for tissue plasminogen activator
C; Comment: This inhibitor acts as "bait" for tissue plasminogen activator
C; Comment: The et also Pai have been identified (see also PIR: A32853 ano oma cells. Vascular endothelial cells may be the primary site of synthesis
C; Comment: Glycosylation is not required for inhibitory activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A;Gene: GDB:PAI1; PLANH1

MISCELLANGOUS: TWO TYPES OF PAI HAVE BEEN IDEN
ACID-STRALE GLYCOPROTEIN FOUND IN PLASMA AND P
ENDOTHELIAL, HEPATOMA, AND FIBROSARCOMA CELLS.
MISCELLANGOUS: VASCULAR ENDOTHELIAL CELLS MAY
OF SYNTHESIS OF PLASMA PAI.
SIMILARITY: BELONGS TO THE SERPIN FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           TPA MAY FUNCTION AS A MAJOR CONTROL FIBRINOLYSIS.

DISEASE: HIGH CONCENTRATIONS OF THI WITH HUMAN THROWBOEMBOLIC DISEASE.

MISCELLANEOUS: PAII IS INACTIVATED UROKINASE-TYPE (U-PA) AND THE TISSU
                                                                                                                                                                                                                                                                                                                                      1A7C; 23-MAR-99
